Package: RColorConesa (via r-universe)

October 31, 2024

Title Conesa Colors Palette

Version 1.0.0

Maintainer Pedro Salguero Garcia <pedrosalguerog@gmail.com>

Description Provides a collection of palettes designed to integrate with 'ggplot', reflecting the color schemes associated with 'ConesaLab'.

`colorConesa` *Retrieve Colors from ConesaLab's Palettes*

Description

The `colorConesa` function facilitates the extraction of a specified number of colors from the ConesaLab's curated color palettes. This function is designed to obtain a set of colors for their scientific visualizations.

Usage

```
colorConesa(n, reverse = FALSE, palette = "complete")
```

Arguments

`n`	An integer specifying the number of colors to be extracted from the chosen palette.
`reverse`	A logical value indicating whether the colors in the selected palette should be reversed (Default: `FALSE`).
`palette`	A character string specifying the name of the desired palette from the `conesa_palettes`. Available options include: "main", "nature", "sunshine", "hot", "warm", "cold", and "complete" (Default: "complete").

Details

ConesaLab's color palettes, available within the package, are tailored for scientific data visualization. The `colorConesa` function is built upon these palettes, offering flexibility in color selection based on the user's requirements. It integrates with the `palette` argument to choose the color thematic.

It's essential to note that if the requested number of colors (`n`) is less than or equal to the size of the chosen palette, the function will directly extract the colors without interpolation. However, if `n` surpasses the palette size, interpolation is employed to generate the required colors.

Value

A character vector of colors corresponding to the specified number and palette.

Author(s)

Pedro Salguero Garcia. Maintainer: pedsalga@upv.edu.es

Examples

```
library(ggplot2)
data("iris")
colorSpecies <- colorConesa(3, palette = "cold")
plot(x = iris$Sepal.Length, y = iris$Sepal.Width, col = colorSpecies[iris$Species], pch = 16)
```

`conesa_cols` *Function to extract conesa colors as hex codes*

Description

Function to extract conesa colors as hex codes

Usage

```
conesa_cols(...)
```

Arguments

`...`	Character names of conesa_colors

`conesa_pal` *Interpolate a Conesa Color Palette*

Description

The `conesa_pal` function offers a flexible way to interpolate colors from the Conesa color palettes. This function provides an interface to generate a range of colors based on the selected Conesa palette, allowing for enhanced customization in scientific visualizations.

Usage

```
conesa_pal(palette = "main", reverse = FALSE, ...)
```

Arguments

`palette`	A character string specifying the name of the desired palette from the `conesa_palettes`. Available options include: "main", "nature", "sunshine", "hot", "warm", "cold", and "complete".
`reverse`	A logical value indicating whether the colors in the selected palette should be reversed. Default is `FALSE`.
`...`	Additional arguments to be passed to the `colorRampPalette` function from the `grDevices` package.

Details

The Conesa color palettes, available in the RColorConesa package, have been specifically curated for scientific visualizations. The `conesa_pal` function leverages the `colorRampPalette` function from the `grDevices` package to interpolate between the colors of the chosen Conesa palette. This interpolation capability ensures that users can generate a continuous range of colors, suitable for representing a wide variety of data types and scales. Whether visualizing continuous data gradients or categorical distinctions, the interpolated Conesa palettes can provide clarity and aesthetic appeal to the visual representation.

`conesa_palettes` *Conesa color palette*

Description

Conesa color palette

Usage

```
conesa_palettes
```

Format

An object of class `list` of length 7.

`getConesaColors` *Retrieve Conesa's Main Color Set*

Description

The `getConesaColors` function provides access to a curated set of colors that are part of the RColorConesa package. These colors have been specifically chosen for their utility in scientific visualizations.

Usage

```
getConesaColors()
```

Details

When using the `getConesaColors` function, users can seamlessly integrate these colors into their R visualizations, benefiting from the expertise embedded in the Conesa color selection.

Value

A list containing the primary colors from the Conesa collection. Each color in the list is represented as a hexadecimal color value.

Author(s)

Pedro Salguero Garcia. Maintainer: pedsalga@upv.edu.es

Examples

```
getConesaColors()
```

`getConesaPalettes` *Return Conesa Color Palettes*

Description

The `getConesaPalettes` function retrieves a collection of color palettes, specifically designed for scientific visualizations. These palettes are part of the Conesa collection.

Usage

```
getConesaPalettes()
```

Details

By using the `getConesaPalettes` function, users can access these palettes and incorporate them into their visualizations, ensuring that their plots and graphs are both informative and visually appealing.

Value

A list containing the various color palettes from the Conesa collection. Each palette in the list is represented as a vector of color values.

Author(s)

Pedro Salguero Garcia. Maintainer: pedsalga@upv.edu.es

Examples

```
getConesaPalettes()
```

`scale_color_conesa` *Color scale constructor for conesa colors*

Description

The `scale_color_conesa` function provides a mechanism to integrate ConesaLab's curated color palettes into `ggplot2` visualizations.

Usage

```
scale_color_conesa(palette = "main", continuous = FALSE, reverse = FALSE, ...)
```

Arguments

`palette`	A character string specifying the name of the desired palette from the `conesa_palettes`. Available options include: "main", "nature", "sunshine", "hot", "warm", "cold", and "complete" (Default: "main").
`continuous`	A logical value indicating whether the color aesthetic represents continuous data (Default: `FALSE`).
`reverse`	A logical value indicating whether the colors in the selected palette should be reversed (Default: `FALSE`).
`...`	Additional arguments passed either to `discrete_scale` or `scale_color_gradientn` from the `ggplot2` package, depending on the value of the `continuous` parameter.

Details

The `scale_color_conesa` function acts as a bridge between these palettes and the `ggplot2` package, allowing users to apply the palettes to their plots Depending on the nature of the data (continuous or discrete), the function intelligently selects the appropriate scale from `ggplot2` to render the colors.

When the `continuous` parameter is set to `TRUE`, the function employs the `scale_color_gradientn` function from `ggplot2` to generate a continuous color scale. Conversely, for discrete data, the `discrete_scale` function is utilized. This ensures that the chosen palette is optimally represented in the plot, irrespective of the data type.

Value

A `ggplot2` scale function suitable for adding to a `ggplot2` object.

Author(s)

Pedro Salguero Garcia. Maintainer: pedsalga@upv.edu.es

Examples

```
library(ggplot2)
data("iris")
g <- ggplot(iris, aes(Sepal.Width, Sepal.Length, color = Species))
g <- g + geom_point(size = 4)
g <- g + scale_color_conesa(palette = "main")
```

`scale_fill_conesa` *Fill scale constructor for conesa colors*

Description

The `scale_fill_conesa` function provides a mechanism to integrate ConesaLab's curated color palettes into `ggplot2` visualizations.

Usage

```
scale_fill_conesa(palette = "main", continuous = FALSE, reverse = FALSE, ...)
```

Arguments

`palette`	A character string specifying the name of the desired palette from the `conesa_palettes`. Available options include: "main", "nature", "sunshine", "hot", "warm", "cold", and "complete" (Default: "main").
`continuous`	A logical value indicating whether the color aesthetic represents continuous data (Default: `FALSE`).
`reverse`	A logical value indicating whether the colors in the selected palette should be reversed (Default: `FALSE`).
`...`	Additional arguments passed either to `discrete_scale` or `scale_fill_gradientn` from the `ggplot2` package, depending on the value of the `continuous` parameter.

Details

The `scale_fill_conesa` function acts as a bridge between these palettes and the `ggplot2` package, allowing users to apply the palettes to their plots Depending on the nature of the data (continuous or discrete), the function intelligently selects the appropriate scale from `ggplot2` to render the colors.

When the `continuous` parameter is set to `TRUE`, the function employs the `scale_fill_gradientn` function from `ggplot2` to generate a continuous color scale. Conversely, for discrete data, the `discrete_scale` function is utilized. This ensures that the chosen palette is optimally represented in the plot, irrespective of the data type.

Value

A `ggplot2` scale function suitable for adding to a `ggplot2` object.
